Potential competing interests: No potential competing interests to declare.

General Comments:

1. The presentation of the paper is well organized and clear.
2. However, the title does not totally reflect the output.
3. In the analysis part (Section 2.4 onwards), the author failed to show how the GIS was used in reducing the UFW. It is recommended that the author should discuss how the GIS was used in the analysis or in determining key outputs of the study (i.e., reduction in UFW).
4. Majority of the authors listed in the reference section are not cited in the main text and vice-versa.
5. Consider revising the paper.
