

Review of: "Unlocking Complexity: The Versatility of Substrate Modulation Equations in Enzyme Analysis"

Abir Bose

Potential competing interests: No potential competing interests to declare.

1. The author has very well explained and derived the equation in a much simpler form, but I feel that the author should explain the meaning of each term used in the equations. Although he did explain some of the terms used in equations, but in many cases, the author has not written what each term signifies.
2. Even though the author has simplified the equations, somewhere the overall objective of this article is lacking. The author can sum up the work by taking up an example where these simplified equations can play a major role in modeling complex biological interactions.
