The article provides a good overview regarding assessment of dredging and its impact on fisheries. But there are some comments that I want to be addressed, including explicitly providing the objectives of the study and the research question that was addressed by this study. The abstract needs to be one paragraph instead of multiple paragraphs, and in the results, there were no disaggregated data on the top 10 fish species caught in the area and their production. By providing the fish species caught in the area, they can also determine whether these are commercially caught or utilized in the area and whether their fish production declined through time. To associate or correlate fish biomass decline with the dredging, more data such as fish production per year in the area affected and when the dredging occurred are needed. The authors also need to address what they stated as their desire "to reveal the impact of dredging on fishery resources and how to achieve this by analyzing the statistical reports from the period 2010-2020"; this was not done by them. I hope the authors will work on that in their next version.
