Potential competing interests: No potential competing interests to declare.

The article is very original in that it examines the relationship between materiality and time. That is, it considers the relationships between the structure of time (existential and ontological) and chemical transformations.

The author of reference is Heidegger, and the author emphasizes the emergence of the concept of time understood as ontology.

The structure of the paper is very well distributed, there is an introduction with a comprehensive abstract, division into topics and paragraphs. In the conclusion, the author's position with respect to the consideration of existentiality, time with ontological materiality is very clearly understood.
