In this paper, some summaries of Lie groupoids and bundles are stated, VB-groupoids are defined, and several examples are given.

I have the following comments:

1. The paper has some typos.
2. In the paper, 5 references are written, but they are not cited in the text of the paper at all. Hence, it is not clear where the materials come from.
3. In Example 1, a covering space is an example of what? That looks as if it is a definition rather than an example.
4. In the paper, the main example is Example 8, in which the second Lie groupoid should be stated clearly. In the same example, "Lie group object" should be stated and related to internal categories.
