Though a well-written article, I have certain comments/queries.

1. What are the side effects of Methylsulfonylmethane when given to any patient?
2. What is the action of gastric secretions on MSM?
3. This is more of a case study rather than a research article, as it reports the treatment with MSM in only one patient.  
The author is advised to conduct trials on a larger number of patients so that substantial data is generated and it becomes more specific for the scientific community.
4. I feel that the results cannot be generalized on the basis of one patient only.
5. The author needs to look into these points before publishing it in any journal; also, the references should be according to the format of the journal.
