**Potential competing interests:** No potential competing interests to declare.

This paper lacks the academic rigour it deserves if one looks at each aspect discussed. There is a huge mismatch or chain of logic or academic structure. I will list each element and how they miss the point.

Abstract – What is the takeaway from this abstract, only rationale of the study? How and what in the form of processes of data and findings is not entertained.

Moving to the Next Stage – How did we get to this part without an introduction? Nevertheless, the link between investment and innovation economy drivers is created.

Envisioning India in Amrit Kaal – What is the purpose of this subsection? It does not discuss the philosophy or ideology of or behind Amrit Kaal's agenda. The stats presented are useless if the study chain of logic is missing.

Diversity and inclusion are essential in the current climate – Firstly, the subheading is a recommendation of some sought; what informed this statement? Is it research or observations? Also, why change from % to use the word per cent? This is not consistent for an academic paper.

Focusing on Higher Education to Foster an Innovation-Driven Economy – This is well crafted to give a reader an inside view of the influence of HEi in Innovation.

Utilizing technology as an Enabler – Is the infrastructure ready to take up this role and make an economy out of it?

In conclusion, this piece has no conclusion.
