Potential competing interests: No potential competing interests to declare.

The title is very general and broad but the abstract and the body looks like a case study. Some of the sentences need revisiting to reflect the idea in the title. It has to be made clear if this article is a review, case study, or opinion letter.

Some sentences need to revise. For example, ...the best approach to prevent and rehabilitate... But it does not indicate what to prevent or from what to prevent.

The paragraph on Land degradation... is difficult to follow. A lot of ideas put together and full of run-ons.

The use of "etc" is not recommended in a scientific writing.

I prefer the word "poorest" be replaced with descriptive terms.

Although the title is on semi-arid regions but did not see any information on the Sahel. There are some figures expressed in percentage, but no source indicated or if study was conducted, it is not clear, and consistency of those figures need to be verified.

"...Key condition" may not be necessary to mention every time.

Capitalization of sub-titles need to be revisited.

Figure 2: may be better to put in a cause-and-effect model.
