The article titled "Digital UAE - a platform for demographic processes management" is a well-crafted and informative piece that provides a comprehensive understanding of the Digital UAE model and its potential applications. The authors of the chapter exhibit a commendable understanding of the challenges and opportunities associated with demographic management in the UAE. The proposed integration of the Digital UAE model with the SED model presents a promising concept that has the potential to significantly improve forecast accuracy.

However, my detailed comments on the manuscript are as follows. Firstly, the abstract's brevity and conciseness do not effectively convey the article's contribution to the existing literature. Secondly, to enhance the quality of an academic article, it is advisable to thoroughly review the language used. Commencing a paragraph with the phrase "first of all" may not be the most suitable approach. Therefore, my initial suggestion would be to revise the language in its entirety.

Furthermore, the true objective of the paper remains undisclosed, making it challenging to ascertain the scientific attribution of the document. There is also a lack of clarity in defining research questions and hypotheses. Additionally, figures may not contain all the requisite information, such as axis labels, rendering them incomplete (e.g., Figure 2, 3, and 4). The explanation of the scenario estimates is inadequate, and the methodological approach used to calculate these estimates remains unknown.

Finally, the article has room for improvement by expanding on the Discussion section and offering more explicit theoretical and practical implications of the research.
