The manuscript being evaluated explores an interesting subject, and the paper is well written. However, the following notes should be taken in consideration : The abstract should contain information on the importance of control and the performance features. Secondly, although the introduction identifies the drawbacks, it does not fully explore them, therefore it should be addressed by adding further details. Furthermore, the core algorithm proposed in the paper is not well-connected to the issues outlined in the introduction, and that the relationship with the model is insufficient. We recommend that this should be rectified. On the other hand, the authors must add the studied generator and turbine specifications and parameters. Finally, suggests that the conclusion should be improved.
