Potential competing interests: No potential competing interests to declare.

I made changes to the text that is attached. There is an exacerbation of the eventual use of the proposed 4 plant items mentioning antibiotic resistance. Emphasis should have been placed on the complementary aspects, not the replacement of procedures. Authors must be aware that antibiotic resistance is a very vast field, as resistance genes have been discovered in the Arctic and Antarctic poles, as well as in deserts where mankind was never present, neither were medicines.
