Green agriculture is essential for ensuring food security and simultaneously mitigating negative environmental impacts. This document explores the concept of "Green Solutions" in agriculture, with special attention being paid to environmental sustainability and biodiversity conservation, as well as solving problems of food security and population growth. The study concluded that climate change resilience in the Turkish agricultural sector can be significantly enhanced through sustainable agriculture, which is supported by policies and economic indicators that are environmentally conscious. This study offers ideas and suggestions for creating a more sustainable agricultural landscape in Turkey, contributing to the ongoing debate about the coexistence of environmental protection and economic development.
