The article is carefully written, and this allows a correct understanding of the proposed objectives and the methodology followed. The method is correct, and the formation of groups and their evaluation is also correct. The VR technology is appropriate, and the results are in line with the proposed objectives. The discussion made of them is well done and allows conclusions to be formulated regarding what has been stated. The conclusions are limited, but this is because the claims of the exposed work also have a limited scope. From my point of view, the greatest weakness of the manuscript is the review of background information and previous studies, which is scarce and of limited scope. There is a lot written about urban gardens, and the authors avoid going into their assessment by saying that the layout and number of gardens have no influence, but this should be scientifically demonstrated in a larger study. Personally, I dispute this. My assessment of all the work is good, although it is limited in scope. The work is not ambitious from the beginning, and this is understandable, but it is a good study that goes in the right direction and is worthy of publication.
