Potential competing interests: No potential competing interests to declare.

The article is a theoretical discussion and does not necessarily need to present practical experiments. The article cannot present experimental results because it needs well-structured examples of its topic.

What are the proposed solutions and the challenges, even if in the field of hypothesis, being supported by other references? This makes it difficult to understand the proposal and the article's contribution.

The author should better elaborate on his contributions to show what the state of the art shows as possible solutions and then carry out the necessary criticism for each contribution.

If the author has ideas that have not yet been tested but can help the state of the art to evolve, he should describe them so that peers can test them if they are interested.
