Reviewer comments

In the study, detailed information was given about the 6 species for which stock studies were conducted. No significant emphasis was placed in the introduction on why these species are important. Additionally, the introduction to the study is written very briefly and is not sufficient.

It would be more appropriate to include a map of the sampling area in the paper.

The discussion section should be improved. The discussion should be evaluated with a broader literature review.

In my opinion, the paper needs a comprehensive, thorough revision.
