

Review of: "Identifying Psychological Distress Patterns during the COVID-19 Pandemic using an Intersectional Lens"

Shuyun Liu

Potential competing interests: No potential competing interests to declare.

This is an interesting study in which cross-vision, conditional inference and random forest trees were used to examine the impact of different variables (gender, age, economic status and ethnic group, etc.) on psychological distress at the beginning of the pandemic, so that psychological experts can implement targeted intervention. The article is somewhat lengthy, such as the Introduction, if it can be more concise and better.
