Potential competing interests: No potential competing interests to declare.

The author intended to explore university students' knowledge and attitudes about the impact of environmental education on waste segregation. This study is exploratory. The author mentioned the study design as a "post-test only experimental design," which is completely wrong. There was no information in the methodology section regarding grouping and selection criteria for recruiting the study participants. Moreover, the author recruited the participants through purposive sampling ("The purposive sampling technique was adopted for the study" ), a type of non-probability sampling. For running a test of hypothesis (in this manuscript, t-test), the sample must be recruited through probability or random sampling. As the study design and sampling were not appropriate, the findings of this exploratory data do not add any value to science. So please reject this manuscript.
