Prevalence and Determinants of Hypertension Among Adults in Urban Bonaberi District of Douala, Cameroon

General:

This is a clear and very well-written manuscript on the Prevalence and Determinants of Hypertension Among Adults in the Urban Bonaberi District of Douala, Cameroon. The manuscript provides valuable data to the field of hypertension research, particularly on the perception and behavior regarding the causes and prevention of hypertension.

Some minor Comments

Methodology:

Needs to describe the sampling techniques used to recruit study participants, i.e., whether the study participants were enrolled conveniently as they were found in the household and met the criteria or otherwise. Also, the author did not describe the consent process, whether the participants were informed about the importance of the study and their rights, and then signed the consent form before enrollment in the study. The author needs also to describe the details on statistical analysis in detail; for example, the data were analyzed by univariate and multivariate analysis.

Results:

The author is advised to summarize predictors in tables so that it will be easy for the reader to follow.
