## Summary:

It presents a brief introduction to the topic and the clear objective. It does not mention the methodological part, nor the summary of the results. If there is space for this, I suggest you do it.

## Introduction

It is exactly the same as the summary. I suggest presenting the theme, justifications and objective more completely.

## Development

I suggest briefly composing how it was prepared methodologically, how the bibliographical references were found.

Contextualizes the study in light of current scientific references

The definition of neurodevelopmental disorders in children is succinct but complete. I suggest including cerebral palsy in item b) early-onset childhood neurodevelopmental disorders, as it is a recurrent diagnosis.

The text is generally clear and concise.

It was actually described for the rapid understanding of neuropsychological professionals, so that they have more information about the most recurrent neuropsychological diseases and that they can carry out future work aimed at other disorders of a genetic or environmental malformation or those of early onset to which it is given. attention from other areas of health (mention in addition to neurosurgery, neuroinfirmity, physiotherapy, speech therapy, occupational therapy).
