# Enalaprilat Anhydrous

National Cancer Institute

## Source

National Cancer Institute. *Enalaprilat Anhydrous*. NCI Thesaurus. Code C76135.

The anhydrous form of enalaprilat, a dicarbocyl-containing peptide and angiotensin-converting enzyme (ACE) inhibitor with antihypertensive activity. Enalaprilat competitively binds to and inhibits ACE, thereby blocking the conversion of angiotensin I to angiotensin II. This prevents the potent vasoconstrictive actions of angiotensin II and results in vasodilation. Enalaprilat also decreases angiotensin II-induced aldosterone secretion by the adrenal cortex, which leads to an increase in sodium excretion and subsequently increases water outflow.
