

# Review of: "Exploring the ATP Synthesis in Unique Cellular Structures: A Preliminary Hypothesis"

Diego Tomassone

Potential competing interests: No potential competing interests to declare.

The proposed hypothesis is undoubtedly very interesting, but unfortunately, as other Members have already pointed out, the interpretation of the results obtained is not sufficiently clear.

I agree that it is not clear how  $\text{H}_2\text{PO}_4^-$  could help to identify the proposed hypothesis and should be better explained how it is intended to isolate, or at least control, the various reactions in which ATP may be involved.

I therefore recommend that you review the manuscript and take advantage of our ideas for reflection.

Thank you, a cordial greeting and good job.

D.T.
