# Cefmenoxime Hydrochloride

National Cancer Institute

## Source

National Cancer Institute. *Cefmenoxime Hydrochloride*. NCI Thesaurus. Code C65296.

The hydrochloride salt form of cefmenoxime, a third-generation, semi-synthetic, beta-lactam cephalosporin antibiotic with antibacterial activity. Cefmenoxime binds to penicillin-binding proteins (PBPs), transpeptidases that are responsible for crosslinking of peptidoglycan. By preventing crosslinking of peptidoglycan, cell wall integrity is lost and cell wall synthesis is halted.
