Thank you very much for inviting me, and in the short time I had, I did a general review and gave feedback on important points to ensure the success of these respected authors.

It looks like a very valuable and interesting work provided that they apply some fine points in this article which deserves to be published, but it seems that the researchers are novices and have little experience in writing articles, who need guidance in this field to ensure their success.

Please convey my and other reviewers' important feedback to them and publish the article without any delay after they standardize it.

1. In general, they should know the necessary standards for writing a professional article, for example, they should know the principles necessary for writing an abstract or introduction and other parts of the article, such as the legend of the image, etc.

2. The methodology must be strong and clear, and we must cite it from every protocol that we have used, and we must state it from every formula or equation that we have used.

3. If the main images of the text are of low quality, we should increase their resolution with the aid of the software, and also the graphical abstract is better if it is a little clearer.

4. We must be careful in interpreting the results and present a strong discussion and robust conclusion.

5. It seems that English is written a little weakly, and with the help of Thesaurus English software, which has the synonyms of all the words, you can make your English text stronger, and also take help from Google Translate and translate the sentences you want in short, that is, write in the language of your country and get its English equivalent and read carefully to make sure the sentence is correct and then insert it in the article.

6. To improve the quality of your article, you should revise it at least three times to fix any type of problem.
