Potential competing interests: No potential competing interests to declare.

The manuscript starts off well; however, the methodology followed could have been standardized. The authors mention, "In the offline survey, we used a question paper which we distributed to students majoring in nutrition that we know and meet at the university. It took me 10 minutes to be able to complete this whole set of questions."

This part is rather vague. The type of Likert scale used has not been mentioned, and hence it is hard to understand the result analysis.

The discussion and conclusions drawn are adequate.
