GSN wt Allele

National Cancer Institute

Source

National Cancer Institute. *GSN wt Allele*. NCI Thesaurus. Code C150252.

Human GSN wild-type allele is located in the vicinity of 9q33.2 and is approximately 125 kb in length. This allele, which encodes gelsolin protein, plays a role in both assembly and disassembly of actin filaments. Mutation of the gene is associated with Finnish type familial amyloidosis (amyloidosis V).
