# Review of: "Ordinary Boldness or Parasitic Mind Control? A Case of Crocodile Nest-Raiding Raccoons in the Florida Keys"

Pierre Charruau<sup>1</sup>

1. Conservación de la Biodiversidad, El Colegio de la Frontera Sur, San Cristóbal de las Casas, Mexico

Interesting work.

My biggest question here is how the authors know whether or not the other raccoons were infected with *Toxoplasma gondii*. If the idea is to compare the reaction of the infected raccoon with other uninfected raccoons to the defense of the female crocodile's nest, then they should be sure of the degree of infection of all the raccoons.

Authors should indicate the scientific name of the Key Largo Woodrat.
