Editor's note: I appreciate the opportunity to review this paper. The topic of debate is extremely relevant and has a significant impact on society. But in order to get better, I have the following questions:

1. Which strains of rats and mice were used?
1. It appears that this was a pilot study.
2. Rat and mouse PTZ testing carries a high risk of death. Justify the quantity of animals used in this study.
3. GC-MS qualitative and quantitative analysis is essential.
4. Why was the plastic used to make the mortar and pestle?
5. Why wasn't the unrefined MP juice (alcoholic or aqueous) concentrated?

Best wishes!
