**Potential competing interests:** No potential competing interests to declare.

When somebody writes an article titled “What Went So Wrong in \*\*\*\*” (where \*\*\*\* could be any field), it raises a serious red flag because it is hard to imagine how we can reasonably criticize an entire field consisting of researchers with diverse views. The present article discusses the debate on whether to use an increasing- or decreasing-returns-to-scale production function. The topic may have been of interest 100 years ago when economics was much less developed, but I don't think modern readers would be interested in this topic unless it is a serious empirical work. In fact, most references are either self-citations (I counted 21) or very old (before 1980), which suggests that the author is not up-to-date with modern economic research.
