Potential competing interests: No potential competing interests to declare.

The author has found a result based on 'model (3)' as called in the manuscript. It would be nice if author provides a brief recap of model (3).

There is also some ambiguity in notations. For example, author declares a and b are for measurement settings and then using the same symbols as an output. It sort of creates confusion.

I think a clear segregation between model (3) and author's results would be helpful.
