This is an interesting article, offering a new insight into how innovation works. It is written well and it is clear. I would like to see more details about the methodological approach and how the parameters were chosen for the DI. Also, it is not clear whether the DI for the publications can be compared to the DI for innovations. Is there evidence for such a comparative approach. Finally, as with all models, the DI cannot take all factors into consideration, and the article is missing the description of the limitations of the methodological approach.
