

Review of: "Nutritional Status and Dietary Patterns of Children Aged Ten Years and Below In the Buea Municipality, South West Region Cameroon"

Alessandra da Silva Pereira

Potential competing interests: No potential competing interests to declare.

The paper is very relevant. It's well written and objective. Some considerations:

In data analyses - "Simple logistic regression was used to screen predictors at p-value < 0.02" - doesn't the authors mean 0,20?

In methods the authors could detail how the dietary patterns were assessed. For exemple what is a high, mediou or low score?

In the analysis the authors considered any variable of adjustment?

Results: there are a lot of tables. The regression they can show in one table.

Table 7 - Monthly income (FCFA) add p-value.
