Fundus pulverulentus

INSERM

Source

INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base*. Fundus pulverulentus. ORPHA:99004

Fundus pulverulentus is a rare form of patterned dystrophy of the retinal pigment epithelium characterized by a granular appearance in the macula, with coarse and punctiform mottling of the retinal pigment epithelium within the macular region. Association with choroidal neovascularization has been reported.
