This is the review of "Stellate ganglion block for anosmia and taste disturbance due to Long-COVID". This paper is similar in nature to prior publications by Dr Liu. I believe it would be helpful for the authors to clarify what makes the current paper different from prior publications especially due to N=1 of the report. Further, the lack of follow up needs to be addressed, how long has the effect last? Finally, the discussion section focuses on ACE-2 receptor effect of covid is correct of course yet it is not clear how SGB impacts that system. It is more likely that SGB effect on long Covid syndrome is via inflammatory pathway.
