Potential competing interests: No potential competing interests to declare.

This manuscript describes the detection of *Staphylococcus aureus* from dairy farms. The topic is interesting. However, some parts and discussions of the manuscript need to be revised:

1. As a general point, authors should revise the English.
2. The Objective section should be well written.
3. The introduction section should be revised, and some terms need to be clarified and substituted. For example, replace "The organism " by "the microorganism."

Some parts in the introduction should be reorganized and rewritten using relevant sentences.

4. Materials and Methods: In this section, the used methods are not updated. Recently, PCR assays have been performed to detect *S. aureus* and to highlight the MRSA issue.
