One of the initial application areas of the Green's function method is celestial mechanics. This article provides an in-depth exploration of the relationship between cosmic symmetry and Newton's law of gravity based on the Green's function method. The author demonstrates a deep understanding and solid knowledge foundation in related fields, which makes the entire article highly academic. In addition, the lack of experimental data to verify the conclusions mentioned at the end of the article indicates that the author has a clear understanding of the rigor of research methods. This is particularly important for highly theoretical research, as it emphasizes the connection between theoretical derivation and actual observation. Overall, this article provides some enlightenment and novelty in the exploration of the symmetry of the universe and the law of gravity, and is of great reference value for researchers in related fields.
