**Potential competing interests:** No potential competing interests to declare.

The article is very informative and important for the ecology and distribution of the *Henckelia* genus (Gesneriaceae). The images are pretty, and the text is well-written. Its publication and the results obtained are significant for the taxonomy of the genus and family.

**Abstract:** The summary should be a small sample of the paper, being an attraction for reading the entire paper.

**Keywords:** Replace keywords with words that are not in the title to expand future searches for the topic.

The genus *Henckelia* Spreng. currently has 78 species (see GRC - Gesneriaceae Resource Center).

**Habitat and ecology:** Describe in more detail; the text explains little about the ecology and habitat.

**Distribution and specimens examined:** Present data in another way. You could text continuously, with both pieces of information together.

**Notes:** The discussion is excellent and very informative. It completed the paper perfectly. I suggest adding an exception from this paragraph in the abstract.
