Potential competing interests: No potential competing interests to declare.

This paper presents an intelligent transportation system with real-time tracking. It is a good work with the implementation and experiment.

From a scientific point of view, this work has some flows.

First, there is no related work discussion. There are lots of works developed and published in this field. Therefore, it is impossible to evaluate the contribution and originality of the work.

Second, the evaluation is missing. How did you evaluate the effectiveness and feasibility of the system? How do you support your claim of improved passenger experience and reduced waiting times?

Finally, the text also needs improvements. The manuscript is repetitive in several parts, such as the Introduction, Section 4, and Section 5.
