Monoclonal Antibody F19

National Cancer Institute

Source

National Cancer Institute. *Monoclonal Antibody F19*. NCI Thesaurus. Code C2514.

A murine monoclonal antibody (MoAb) against human fibroblast activation protein (FAP). FAP is a 95 kDa cell surface glycoprotein and an inducible tumor stromal antigen of epithelial cancers and of a subset of soft tissue sarcomas. FAP shows a very limited distribution pattern in normal tissues, thereby MoAb F19 has possible diagnostic and therapeutic applications in epithelial cancers.
