Potential competing interests: No potential competing interests to declare.

In this manuscript, the authors attempt to provide commentary on the implication of the significance of the circulating HPV DNA detection for early diagnosis and the efficacy of cancer immunotherapy for advanced/recurrent malignant tumors associated with HPV infection. This information could be beneficial for future clinical strategies against HPV-associated advanced/recurrent malignancies.

However, there are several considerations:

- 1. It is highly recommended to undertake a thorough proofreading of the manuscript to enhance linguistic refinement and structural coherence. For instance, it is currently challenging to discern the authors' key statement solely from the abstract
- It would be advantageous to include information elucidating the scientific and/or clinical significance of circulating HPV
 DNA in the blood and the importance of the early diagnosis of HPV infection to augment the authors' key concept in
 this manuscript.
- 3. The data source and/or description of Figure 1 is currently absent. Please provide it.
