I think «Collaborative Intelligence: A scoping review of current applications» offers an interesting insight into emerging phenomena of great interest to many fields of work life and society, not to mention research. I think the article might benefit from some extensions.

The article briefly mentions near lying themes like «Collective intelligence». Maybe a short rundown on similarities/overlap and differences could have been included. Other terms relating to similar real-world terms like the older «crowdsourcing» or «crowd research» might perhaps also have been discussed. Furthermore, the section «Current constraints and future directions for collaborative intelligence» may perhaps slightly limit the scope a bit too much?

In combination with crowdsourcing through social media, 'wisdom of crowd' may perhaps be released for both gathering data and analysing them, creating new insight into patterns and mechanism in the market or society, otherwise hidden from view.
