Potential competing interests: No potential competing interests to declare.

Paper addresses prevalence, misdiagnosis, and co-infection rates of dengue, malaria, and typhoid in rural Southwest Nigeria.

Methodology is robust but lacks detail in sample size determination, participant criteria, quality control, and ethical considerations.

Results presentation needs clearer explanations and consistency in reporting units.

Discussion should offer deeper interpretations, comparisons with existing literature, and recommendations for future research.

Overall, improving clarity and addressing these areas will enhance the paper's impact in infectious disease epidemiology.
