Below are my comments / suggestions on manuscript "Thermal Comfort Temperature Evaluation in Hospital Wards for Patient Safety and Climate Change Sustainability"

- 1) The literature review needs to be structured in such a way as to show relevance and identify the gap addressed by the work.
- 2) The aim of the work must be presented clearly.
- 3) It is not clear from the methodology section what will be done in the work and how it will be done.
- 4) The measuring instruments need to be presented in detail (manufacturer, measuring range and uncertainty).
- 5) The methodology section does not provide an understanding of how the results were obtained.
- 6) In the results section it is necessary to clarify (for figures and tables) what will be presented and include on it a clear discussion of them in comparison with the literature.
- 7) I suggest creating a list of symbols.
