The paper is interesting but lots of things need to be adjusted. First it does not provide the problems statement and the literature review is short and no conceptual literature to interlink between Sectoral GDP and tax revenue. Sometimes descriptive statistics may be more appropriate than panel study for this kind of study. Meanwhile he explained correlation results but not fixed and random effect results. He must explain pooled OLS and he needs to be more serious to understand that panel data of this nature should compare fixed effect and random effect through Hausman test to determine which model is more appropriate for the analysis. He can do some specification tests to see whether serial correlation or normality test of the residual or DW test or heteroskedasticity is present or not. Finally, it requires major revision or reject.
