The overall content and structure is relatively complete, but I have the following suggestions:

1. There is a partial repetition of words. Patient information was presented in the background and mentioned again in the second part. It is recommended that the reference be placed only in the patient information section.
2. The textual description of the picture could be explained in the main text section, and it might be lengthy to put it in the small print section below the picture.
3. The words in figure 3 are not obvious and clear enough and could be enlarged appropriately if important.
4. In the process of discussion and comparison, is it possible to compare the results of different methods?
