Potential competing interests: No potential competing interests to declare.

In this review, the authors describe the differences in tumour microenvironment between hereditary and sporadic breast cancer and the epigenetic mechanisms who contribute to tumorigenesis of hereditary breast cancer.

The manuscript is interesting. The text is clear and well organized. It requires few changes to be published:

- In the abstract, the authors should add what the objectives of this review;
- It would be useful to add a figure or table that summarizes what has been reported in the text, for greater completeness of the manuscript;
- It is necessary to add a section reporting the conclusions.
