This manuscript has accounted for SARS-CoV-2 in cats and dogs worldwide, which is really impressive in the scientific and general communities.

However, I have a few comments:

1. Table 1 shows the data extraction about SARS-CoV-2, which shows the occurrence of SARS-CoV-2 in cats and dogs. I would recommend working on data interpretation because it is difficult for readers to see what is going on. Therefore, use the data to create a bar graph based on the number of cases in each country. To remove bias, you may not include $n = 1$ in the graph but can write them in the paragraph below the graph about why you excluded them in the graph. This will improve the presentation of the data.
2. There is a sub-heading "Risks of COVCID -19 (SARS-COV-2) in Pets". In my opinion, this is a typo. Please correct it.
3. You mentioned "Therefore, there is a risk that pets can be infected by their owners. Infected pets might get sick, or they might not have any symptoms", but how this can occur is not mentioned.
4. A figure on the possible transmission of SARS-CoV-2 is suggested among ferrets and to humans. There are raw data in the paragraphs which should be presented well.
