Dear editor, I appreciate your invitation to review this article. The topic addressed is very relevant and has a high impact on the literature on Epilepsy. However, I have some suggestions for improvement, as follows. In the methodology, the description of the equipment is unnecessary and can be omitted. On the other hand, the qualitative and quantitative analyses of MP juice need more detail on the phytochemical analysis. Regarding the experiments with the model, I think they are adequate, and the results are discussed in relation to the experimental data. The conclusion is pertinent and opens a window for further studies on plants as sources of potential molecules and compounds with therapeutic value.

Warm regards,
