Potential competing interests: No potential competing interests to declare.

The general idea of the work is interesting. However, the Authors need to take into consideration the following points:

1. The grammatical structure and abbreviation are very poor. This makes the work difficult to understand.
2. The methodology should be presented in the past tense, not future, as it is assumed that the work was already carried out before reporting.
3. The abstract was poorly written and should be better presented to tie the work together.
4. The methodology is very sparse. It does not describe the extraction process, determination of oxidative stress, Morris Water Maze Test, as well as the rationale for these tests.
5. The units for the oxidative stress, MWM test, and weight were not indicated in the tables.
6. The micrographs were not properly presented, with the labels unclear and missing from the legend. Magnification and staining are absent, and the legends are not well presented.
7. Discussion is missing from the entire work, and an extensive discussion should be written with relevant references attached.
8. The same reference style should be applied, and recent details should be added.
