Review of: "Algal bloom monitoring in Koka Reservoir, Ethiopia: Application of satellite remote sensing algorithms"

Xiaoping Pang[1]

1 Wuhan University

Major comments:

- It would help a lot if the relationships between FAI / NDCI and phytoplankton were explained in the introduction part. In other words, the objective of this paper is not that clear to me.

- It seems that the authors regard FAI as a benchmark when talking about the results, but there is no clear evidence showing its advantage over NDCI. Validations using in situ Chl might help.

- It would be interesting to see changes of FAI in time series.

Minor comments:

- There are several typos, for instance, in the conclusion part, "NDCL" should be "NDCI". Also, in the caption of Figure5, "FDI" should be "FAI".

- In the "Methods" part, "area" needs to be added to "Description of the study".

- In Figure2(a), it's better to add a 1:1 line for comparisons between a same variable.
