Dear Editor:

I read the manuscript entitled " Determining kinetics parameters of bovine serum albumin protected gold nanozymes toward different substrates " carefully. My suggestion is re-consideration of the work before acceptance. Honorable authors should carefully revise the work based on the following comments:

1. The title is informative and relevant, it could be more specific.
2. More information should be provided in the abstract.
3. The abstract should be full of words DAB and TMB written.
4. Please check experimental section about conditions applied, the procedures used should be cited to refs and be applicable by readers.
5. Please discuss the morphological observations in detail.
6. Correct the number checker in Figure 2 and Figure 3.
7. Conclusion must be improved.
